Description

BACKGROUND OF THE INVENTION

European Patent Applications 166,591 and 275,667 disclose a series of indole-based compounds with activity as prostaglandin antagonists and inhibitors of leukotriene biosynthesis respectively. In EP 181,568 and EP 200,101 are disclosed a series of compounds, containing two aromatic nuclei, which are described as possessing activity as lipoxygenase inhibitors. In EP 279,263 is disclosed a series of indoles, benzofurans and benzothiophenes which are described as possessing activity as lipoxygenase inhibitors. U.S. Patent 4,629,733 describes novel indolinones which are antithrombotic and inhibit both phosphodiesterase and tumor metastasis. The chemical preparation of quinolyndoles is referred to by Sheinkman, *et al.*, Chem. Ab., Vol. 67, 54017 (1967), without mentioning any utility for such compounds. A number of N-acyl derivatives of indole-3-acetic acid are described as potential anti-inflammatory agents by Biniecki, *et al.*, Chem. Ab., Vol. 98, 197936 (1983), by Pakula, *et al.*, Chem. Ab., Vol. 105, 190835 (1986), and in British Pat. Spec. 1,228,848.

SUMMARY OF THE INVENTION

The present invention relates to compounds having activity as leukotriene biosynthesis inhibitors, to methods for their preparation, and to methods and pharmaceutical formulations for using these compounds in mammals (especially humans).

Because of their activity as leukotriene biosynthesis inhibitors, the compounds of the present invention are useful as anti-asthmatic, anti-allergic, and anti-inflammatory agents and are useful in treating allergic rhinitis and chronic bronchitis and for amelioration of skin diseases like psoriasis and atopic eczema. These compounds are also useful to inhibit the pathologic actions of leukotrienes on the cardiovascular and vascular systems for example, actions such as result in angina or endotoxin shock. The compounds of the present invention are useful in the treatment of inflammatory and allergic diseases of the eye, including allergic conjunctivitis. The compounds are also useful as cytoprotective agents and for the treatment of migraine headache.

Thus, the compounds of the present invention may also be used to treat or prevent mammalian (especially, human) disease states such as erosive gastritis; erosive esophagitis; inflammatory bowel disease; ethanol-induced hemorrhagic erosions; hepatic ischemia; noxious agent-induced damage or necrosis of hepatic, pancreatic, renal, or myocardial tissue; liver parenchymal damage caused by hepatotoxic agents such as CCl₄ and D-galactosamine; ischemic renal failure; disease-induced hepatic damage; bile salt induced pancreatic or gastric damage; trauma- or stress-induced cell damage; and glycerol-induced renal failure.

The compounds of this invention are inhibitors of the biosynthesis of 5-lipoxygenase metabolites of arachidonic acid, such as 5-HPETE, 5-HETE and the leukotrienes. Leukotrienes B₄, C₄, D₄ and E₄ are known to contribute to various disease conditions such as asthma, psoriasis, pain, ulcers and systemic anaphylaxis. Thus inhibition of the synthesis of such compounds will alleviate these and other leukotriene-related disease states.

It will be understood that in the discussion of methods of treatment which follows, references to the compounds of Formula I are meant to also include the pharmaceutically acceptable salts.

The ability of the compounds of Formula I to inhibit biosynthesis of the leukotrienes makes them useful for inhibiting the symptoms induced by the leukotrienes in a human subject. This inhibition of the mammalian biosynthesis of leukotrienes indicates that the compounds and pharmaceutical compositions thereof are useful to treat, prevent, or ameliorate in mammals and especially in humans: 1) pulmonary conditions including diseases such as asthma, 2) allergies and allergic reactions such as allergic rhinitis, contact dermatitis, allergic conjunctivitis, and the like, 3) inflammation such as arthritis or inflammatory bowel disease, 4) pain, 5) skin conditions such as psoriasis and the like, 6) cardiovascular conditions such as angina, endotoxin shock, and the like and 7) renal insufficiency arising from ischaemia induced by immunological or chemical (cyclosporin) etiology, and that the compounds are cytoprotective agents.

The cytoprotective activity of a compound may be observed in both animals and man by noting the increased resistance of the gastrointestinal mucosa to the noxious effects of strong irritants, for example, the ulcerogenic effects of aspirin or indomethacin. In addition to lessening the effect of non-steroidal anti-inflammatory drugs on the gastrointestinal tract, animal studies show that cytoprotective compounds will prevent gastric lesions induced by oral administration of strong acids, strong bases, ethanol, hypertonic saline solutions and the like.

Two assays can be used to measure cytoprotective ability. These assays are; (A) an ethanol-induced lesion assay and (B) an indomethacin-induced ulcer assay and are described in EP 140,684.

The magnitude of prophylactic or therapeutic dose of a compound of Formula I will, of course, vary with the nature of the severity of the condition to be treated and with the particular compound of Formula I and its route of administration. It will also vary according to the age, weight and response of the individual patient. In general, the daily dose range for anti-asthmatic, anti-allergic or anti-inflammatory use and generally, uses other than cytoprotection, lie within the range of from about 0.001 mg to about 100 mg per kg body weight of a mammal, preferably 0.01 mg to about 10 mg per kg, and most preferably 0.1 to 1 mg per kg, in single or divided doses. On the other hand, it may be necessary to use dosages outside these limits in some cases.

EP 0 419 049 B1

For use where a composition for intravenous administration is employed, a suitable dosage range for anti-asthmatic, anti-inflammatory or anti-allergic use is from about 0.001 mg to about 25 mg (preferably from 0.01 mg to about 1 mg) of a compound of Formula I per kg of body weight per day and for cytoprotective use from about 0.1 mg to about 100 mg (preferably from about 1 mg to about 100 mg and more preferably from about 1 mg to about 10 mg) of a compound of Formula I per kg of body weight per day.

In the case where an oral composition is employed, a suitable dosage range for anti-asthmatic, anti-inflammatory or anti-allergic use is, e.g. from about 0.01 mg to about 100 mg of a compound of Formula I per kg of body weight per day, preferably from about 0.1 mg to about 10 mg per kg and for cytoprotective use from 0.1 mg to about 100 mg (preferably from about 1 mg to about 100 mg and more preferably from about 10 mg to about 100 mg) of a compound of Formula I per kg of body weight per day.

For the treatment of diseases of the eye, ophthalmic preparations for ocular administration comprising 0.001-1% by weight solutions or suspensions of the compounds of Formula I in an acceptable ophthalmic formulation may be used.

The exact amount of a compound of the Formula I to be used as a cytoprotective agent will depend on, *inter alia*, whether it is being administered to heal damaged cells or to avoid future damage, on the nature of the damaged cells (e.g., gastrointestinal ulcerations vs. nephrotic necrosis), and on the nature of the causative agent. An example of the use of a compound of the Formula I in avoiding future damage would be co-administration of a compound of the Formula I with a non-steroidal anti-inflammatory drug (NSAID) that might otherwise cause such damage (for example, indomethacin). For such use, the compound of Formula I is administered from 30 minutes prior up to 30 minutes after administration of the NSAID. Preferably it is administered prior to or simultaneously with the NSAID, (for example, in a combination dosage form).

Any suitable route of administration may be employed for providing a mammal, especially a human with an effective dosage of a compound of the present invention. For example, oral, rectal, topical, parenteral, ocular, pulmonary, nasal, and the like may be employed. Dosage forms include tablets, troches, dispersions, suspensions, solutions, capsules, creams, ointments, aerosols, and the like.

The pharmaceutical compositions of the present invention comprise a compound of formula I as an active ingredient or a pharmaceutically acceptable salt thereof, and may also contain a pharmaceutically acceptable carrier and optionally other therapeutic ingredients. The term "pharmaceutically acceptable salts" refers to salts prepared from pharmaceutically acceptable non-toxic bases or acids including inorganic bases or acids and organic bases or acids.

The compositions include compositions suitable for oral, rectal, topical, parenteral (including subcutaneous, intramuscular, and intravenous), ocular (ophthalmic), pulmonary (nasal or buccal inhalation), or nasal administration, although the most suitable route in any given case will depend on the nature and severity of the conditions being treated and on the nature of the active ingredient. They may be conveniently presented in unit dosage form and prepared by any of the methods well-known in the art of pharmacy.

For administration by inhalation, the compounds of the present invention are conveniently delivered in the form of an aerosol spray presentation from pressurized packs or nebulisers. The compounds may also be delivered as powders which may be formulated and the powder composition may be inhaled with the aid of an insufflation powder inhaler device. The preferred delivery system for inhalation is a metered dose inhalation (MDI) aerosol, which may be formulated as a suspension or solution of compound I in suitable propellants, such as fluorocarbons or hydrocarbons.

Suitable topical formulations of compound I include transdermal devices, aerosols, creams, ointments, lotions, dusting powders, and the like.

In practical use, the compounds of formula I can be combined as the active ingredient in intimate admixture with a pharmaceutical carrier according to conventional pharmaceutical compounding techniques. The carrier may take a wide variety of forms depending on the form of preparation desired for administration, e.g., oral or parenteral (including intravenous). In preparing the compositions for oral dosage form, any of the usual pharmaceutical media may be employed, such as, for example, water, glycols, oils, alcohols, flavoring agents, preservatives, coloring agents and the like in the case of oral liquid preparations, such as, for example, suspensions, elixirs and solutions; or carriers such as starches, sugars, microcrystalline cellulose, diluents, granulating agents, lubricants, binders, disintegrating agents and the like in the case of oral solid preparations such as, for example, powders, capsules and tablets, with the solid oral preparations being preferred over the liquid preparations. Because of their ease of administration, tablets and capsules represent the most advantageous oral dosage unit form in which case solid pharmaceutical carriers are obviously employed. If desired, tablets may be coated by standard aqueous or nonaqueous techniques.

EP 0 419 049 B1

In addition to the common dosage forms set out above, the compounds of formula I may also be administered by controlled release means and/or delivery devices such as those described in U.S. Patent Nos. 3,845,770; 3,916,899; 3,536,809; 3,598,123; 3,630,200 and 4,008,719.

Pharmaceutical compositions of the present invention suitable for oral administration may be presented as discrete units such as capsules, cachets or tablets each containing a predetermined amount of the active ingredient, as a powder or granules or as a solution or a suspension in an aqueous liquid, a non-aqueous liquid, an oil-in-water emulsion or a water-in-oil liquid emulsion. Such compositions may be prepared by any of the methods of pharmacy but all methods include the step of bringing into association the active ingredient with the carrier which constitutes one or more necessary ingredients. In general, the compositions are prepared by uniformly and intimately admixing the active ingredient with liquid carriers or finely divided solid carriers or both, and then, if necessary, shaping the product into the desired presentation. For example, a tablet may be prepared by compression or molding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine, the active ingredient in a free-flowing form such as powder or granules, optionally mixed with a binder, lubricant, inert diluent, surface active or dispersing agent. Molded tablets may be made by molding in a suitable machine, a mixture of the powdered compound moistened with an inert liquid diluent. Desirably, each tablet contains from about 2.5 mg to about 500 mg of the active ingredient and each cachet or capsule contains from about 2.5 to about 500 mg of the active ingredient.

In addition to the compounds of Formula I, the pharmaceutical compositions of the present invention can also contain other active ingredients, such as cyclooxygenase inhibitors, non-steroidal anti-inflammatory drugs (NSAIDs), peripheral analgesic agents such as zomepirac diflunisal and the like. The weight ratio of the compound of the Formula I to the second active ingredient may be varied and will depend upon the effective dose of each ingredient. Generally, an effective dose of each will be used. Thus, for example, when a compound of the Formula I is combined with an NSAID the weight ratio of the compound of the formula I to the NSAID will generally range from about 1000:1 to about 1:1000, preferably about 200:1 to about 1:200. Combinations of a compound of the Formula I and other active ingredients will generally also be within the aforementioned range, but in each case, an effective dose of each active ingredient should be used.

NSAIDs can be characterized into five groups:

- (1) the propionic acid derivatives;

The acetic acid derivatives which may be used comprise: indomethacin, which is a preferred NSAID, acetaminophen, alclufenac, clidanac, diclofenac, fenclofenac, fenclozic acid, fentiazac, furofenac, ibufenac, isoxepac, oxpinac, sulindac, tiopinac, tolmetin, zidometacin and zomepirac. Structurally related acetic acid derivatives having similar analgesic and anti-inflammatory properties are also intended to be encompassed by this group.

Compounds of the present invention can be prepared according to the following methods. Tempera-
20 tures are in degree Celsius.

The starting methoxy phenylhydrazines II are either commercially available or are described in the chemical literature as are the acetamidophenols XXVI. The benzyl phenylhydrazine starting materials III are prepared as described in EP 166,591 (17102 IA) and the ketones IV and XXXI are prepared as described in EP 166,591 and EP 275,667 (17496 IA). The 2-(halomethyl)quinolines VII are available from literature
25 methods described in "Quinolines" Parts I and II, G. Jones (ED.), John Wiley & Sons, Toronto, 1977 and 1982. The preparation of VII by halogenation of the corresponding 2-methylquinolines is also described in the Jones' volumes. The benzyl halides, $(R^{10})_2 \text{PhCH}_2\text{-Hal}$, are readily prepared and many such compounds are described in the prior art, such as U.S. Patent 4,808,608 (17323 IB). Hal in VII and $(R^{10})_2 \text{PhCH}_2\text{-Hal}$ represents Cl, Br or I.

30 Many syntheses of indoles are well-known in the chemical literature: see for example, "Heterocyclic compounds" Volume 25, Parts I, II, III, W.J. Houlihan (Ed.), Interscience, J. Wiley & Sons, N.Y., 1979, and "The Chemistry of Indoles" by R.J. Sundberg, Academic Press, N.Y., 1970. One of the most common syntheses is known as the Fischer Indole Synthesis, and is abbreviated in the following methods as "Fischer".

35 The $-\text{CO}_2\text{H}$ and $-\text{CO}_2\text{R}^{12}$ groups in the intermediates and final products in the various methods can be transformed to other representatives of Q such as $-\text{CONHS}(\text{O})_2\text{R}^{14}$, $-\text{NHS}(\text{O})_2\text{R}^{14}$, $-\text{CONR}^{15}\text{R}^{15}$, $-\text{CH}_2\text{OH}$ or tetrazol-5-yl by the methodology described in U.S. Patent 4,808,608 (17323IV). The preparation of the pro-drug forms (Q is $-\text{CO}_2\text{R}^{17}$) from the acids may be effected by the methodology of EP 104,885 (16830 IA).

40 It will be apparent to one skilled in the art that the various functional groups (R^1 , R^2 , Y, Q, etc.) must be chosen so as to be compatible with the chemistry being carried out. Such compatibility can often be achieved by protecting groups, or by specific variations in the sequence of the reactions.

When R^5 is S-R^7 , the corresponding sulfoxides and sulfones can be prepared by oxidation of the sulfides with one or two equivalents of an oxidizing agent such as m-chloroperbenzoic acid or monoperox-
yphthalic acid or oxone (Trost, J. Org. Chem., 1988, pg.532).

45 Many of the following methods involve a basic hydrolysis of an ester function to obtain the corresponding carboxylic acid. In all cases, the free acid is obtained by acidification of the reaction mixture with a suitable acid such as hydrochloric, sulfuric, acetic, trifluoroacetic acid, etc.

Compounds VIII, XI, XV, XIX, XXXVI and their precursor esters are all examples of the Formula I compounds of the present invention.

Intermediate **V** is prepared by a Fischer reaction between benzylphenylhydrazine **III** and ketone **IV**, followed by hydrolysis with an aqueous solution of an alkali hydroxide or other suitable hydroxide in mixture with a suitable water miscible organic solvent such as tetrahydrofuran (THF) or methanol (MeOH). The methoxy acid **V** is demethylated by heating with an alkali salt of an aliphatic thiol in a suitable solvent such as hexamethylphosphorotriamide (HMPA) or N-methylpyrrolidone (NMP). The reaction mixture is acidified and the crude acid so obtained is converted to the methyl ester **VI** by treatment with diazomethane. The phenol **VI** is coupled to the 2-halomethylquinoline **VII**, by stirring with a base (preferably an alkali hydride or carbonate) in a suitable solvent such as dimethyl formamide (DMF), NMP, acetone or the like. The resulting

EP 0 419 049 B1

ester is hydrolysed by base to yield VIII, a compound of the present invention.

When intermediate V contains a sulfide group attached to position 3, treatment with a Lewis acid, such as AlCl_3 , and an aliphatic thiol, simultaneously effects demethylation and removes the sulfide group. Suitable solvents for this reaction are methylene chloride, 1,2-dichloroethane, etc. The resulting acid is then converted to the methyl ester IX with diazomethane. A Friedel-Crafts reaction between IX and an acid chloride, R^7COCl , simultaneously introduces the acyl substituent into the 3-position of the indole ring and onto the phenolic hydroxyl group. The acyl group is removed from the phenol by treatment with sodium methoxide in MeOH to yield acylphenol X. Phenol X is coupled with VII as described for the coupling of VI and VII above. In these coupling reactions, it is at times advantageous to add a catalyst such as potassium iodide or tetraethylammonium bromide, especially when Hal is chlorine. A final hydrolysis yields compound XI.

Method 2

Intermediate XII is prepared by a Fischer reaction between methoxyphenyl hydrazine II and ketone IV, followed by alkylation of the indole nitrogen, after deprotonation using potassium hexamethyldisilazane in an ether solvent such as tetrahydrofuran (THF), with an alkyl or aralkyl halide.

The methoxy group in XIII is removed using the conditions of Method 1. The corresponding phenol XIV is now coupled with the 2-halomethylquinoline VII by stirring with a base (preferably an alkali hydride or carbonate) in a suitable solvent such as DMF, NMP or the like. The resulting ester is hydrolysed using base to yield XV a compound of the present invention.

When intermediate XIII contains a sulfide at position 3, treatment with a Lewis acid such as AlCl_3 and an aliphatic thiol simultaneously effects demethylation and removes the sulfide group. Suitable solvents for this reaction are dichloromethane or dichloroethane. In a variation of Method 1, the phenolic hydroxyl in XVI is first acylated with the reagent R^7COCl (XVII) in the presence of a weak base such as triethylamine. A Friedel-Crafts reaction is then carried out on the O-acylated intermediate, with an additional mole of XVII and AlCl_3 , to yield the intermediate XVIII. Acyl ester XVIII may then be reduced to a 3-alkyl indole XIV using sodium cyanoborohydride in dichloroethane using a zinc iodide catalyst.

Acyl ester XVIII is cleaved to the indole phenol by hydrolysis with sodium methoxide in methanol and is coupled to 2-halomethyl quinoline VII using a base such as an alkali hydride or carbonate in a solvent such as DMF or NMP. Hydrolysis of the resulting compound using base yields the compound of the present invention XIX.

Method 3

A suitably substituted aminophenol XX is protected on oxygen by the use of pivaloyl chloride dissolved in CH₂Cl₂ using triethyl amine as base. The pivaloate ester XXI is then diazotized using hydrochloric acid and sodium nitrite in an aqueous solvent and the transient diazonium species reduced in situ to the hydrazine XXII using sodium hydrosulfite in water. Benzylation of the hydrazine is effected as described in Method 1.

The O-pivaloyl-N-benzylhydrazine XXIII is subjected to a Fischer indolization using the appropriate ketone IV to produce the indole XXIV. Cleavage of the O-pivaloyl group using sodium methoxide in methanol transforms the product into the phenolic indole VI which is converted to the products of this invention as described in Method 1.

A suitable N-acetylated aminophenol XXVI is reacted with VII using an alkali hydride or carbonate, such as potassium carbonate as a base in a polar solvent like DMF or NMP. The quinolinylmethoxy acetanilide XXVII is then de-acetylated using standard basic conditions, preferably using alcoholic potassium hydroxide under reflux to produce the quinolinylmethoxy aniline derivative XXVIII. Conversion of the quinolinylmethoxy aniline derivative to the hydrazine analogue XXIX is effected through reduction of the intermediate diazonium salt using sodium hydrosulfite in an aqueous medium.

The hydrazine XXIX is then N-benzylated using a benzyl halide in an organic solvent such as methylene chloride containing an amine base such as diisopropylethylamine and preferably tetra-n-butylammonium bromide as catalyst.

The hydrazine XXX is then processed using a Fischer indolization with ketone IV according to Methods 1, 2, 3 and 4 to produce compounds of the present invention.

Hydrazine XXIX may also be transformed directly to unsubstituted indoles by a Fischer reaction with various ketones like XXXI. N-Alkylation of the indoles is effected using the conditions described in Method 2 to produce quinolinylmethoxyindole alkanoate esters XXXII. Such esters are transformed to ketones or carbinols via Grignard conditions using alkyl magnesium halides in ether solvents like diethyl ether or through the use of lithium aluminum hydride in ether solvents like THF. The carbinols XXXIV so produced may be further transformed into ester compounds of the present invention by reacting with α -halo esters XXXV using sodium hydride as base in a suitable solvent like THF. Subsequent hydrolysis of the esters using Method 1 leads to acid compounds of the present invention.

Phenol **XXXVII** is obtained by treatment of **XII** ($R^5 = S-R^7$) with a Lewis acid and a thiol, as in Method 1 for the conversion of **V** to **IX**. Compound **XXXVIII** is then obtained by reaction of **XXXVII** with **VII** in the presence of a base in a suitable solvent, as described for the conversion of **VI** to **VIII** in Method 1. The introduction of R^5 in **XXXIX** is conveniently effected by an electrophilic reaction between **XXXVIII** and R^5-Cl (R^5 not = X^1-R^6). Such reactions are frequently catalysed by Lewis acids or proton acids such as $AlCl_3$, $SnCl_4$, $TiCl_4$, BBr_3 , HCl , HBr and the like. They may be carried out in a variety of solvents, with a preference for non-protonic solvents such as dichloromethane, 1,2-dichloroethane, nitromethane, chlorobenzene and the like. It will be obvious to one skilled in the art, that the chlorine in R^5-Cl , in this and the other Methods, may often be replaced by another halogen or by a hydroxyl group, or R^5-Cl may be replaced by an acid anhydride $(R^7CO)_2O$. An alternative synthesis of **XXXIX** is to effect a Fischer reaction between compounds **IV** and **XXIX**. Introduction of R^8 into **XXXIX**, is accomplished by alkylation with R^8-Hal and a base as described previously for Methods 2, 4 and 6. Finally, hydrolysis of the ester will yield **XV**. Alternatively, the ester group in **XXXIX** can be hydrolysed, and the corresponding free acid ($R^{12} = H$) alkylated on the indole nitrogen with R^8-Hal and an aqueous base, such as $NaOH$, and a phase-transfer catalyst, such as

Method 8

EP 0 419 049 B1**METHOD 8**

Compound XL may be prepared either by the coupling of VI to VII (Method 1) or by a Fischer reaction between IV and XXX (Method 5). Compound XL may be desulfurized by treatment with a Lewis acid such as AlCl_3 , or by reduction with Raney nickel, to give compound XLI. A Friedel-Crafts reaction on XLI with the reagent R^7COCl and a Lewis acid catalyst such as AlCl_3 yields the 3-acyl derivative XLII, hydrolysis of which yields XI. In the Friedel-Crafts reaction, carbon monoxide may be lost and compound XLIII is formed; hydrolysis under standard conditions then yields XLIV. The formation of XLIII occurs when the cation R^{7+} is especially stable and when the reagents R^7COCl and the Lewis acid are mixed before adding XLI. If the Lewis acid is added last, the main product is usually the acylated compound XLII. If a milder Lewis acid such as TiCl_4 is used, the main product is also XLII.

It will be obvious to one skilled in the art that the reagent R^7COCl can often be replaced by $\text{R}^7\text{CO-Hal}$ ($\text{Hal} = \text{F}, \text{Br}$ or I) or $(\text{R}^7\text{CO})_2\text{O}$.

Assays for Determining Biological Activity

55

Compounds of formula I can be tested using the following assays to determine their mammalian leukotriene biosynthesis inhibiting activity.

EP 0 419 049 B1Rat Peritoneal Polymorphonuclear (PMN) Leukocyte Assay

Rats under ether anesthesia are injected (i.p.) with 8 mL of a suspension of sodium caseinate (6 grams in ca. 50 mL water). After 15-24 hr. the rats are sacrificed (CO₂) and the cells from the peritoneal cavity are recovered by lavage with 20 mL of buffer (Eagles MEM containing 30 mM HEPES adjusted to pH 7.4 with NaOH). The cells are pelleted (350 x g, 5 min.), resuspended in buffer with vigorous shaking, filtered through lens paper, recentrifuged and finally suspended in buffer at a concentration of 10 cells/mL. A 500 mL aliquot of PMN suspension and test compound are preincubated for 2 minutes at 37 °C, followed by the addition of 10 mM A-23187. The suspension is stirred for an additional 4 minutes then bioassayed for LTB₄ content by adding an aliquot to a second 500 mL portion of the PMN at 37 °C. The LTB₄ produced in the first incubation causes aggregation of the second PMN, which is measured as a change in light transmission. The size of the assay aliquot is chosen to give a submaximal transmission change (usually -70%) for the untreated control. The percentage inhibition of LTB₄ formation is calculated from the ratio of transmission change in the sample to the transmission change in the compound-free control.

Human Polymorphonuclear (PMN) Leukocyte LTB₄ Assay

A. Preparation of Human PMN. Human blood was obtained by antecubital venepuncture from consenting volunteers who had not taken medication within the previous 7 days. The blood was immediately added to 10% (v/v) trisodium citrate (0.13 M) or 5% (v/v) sodium heparin (1000 IU/mL). PMNs were isolated from anticoagulated blood by dextran sedimentation of erythrocytes followed by centrifugation through Ficoll-Hypaque (specific gravity 1.077), as described by Boyum (Scand. J. Clin. Lab. Invest., 21 (Supp. 97), 77(1968)). Contaminating erythrocytes were removed by lysis following exposure to ammonium chloride (0.16 M) in Tris buffer (pH 7.65), and the PMNs resuspended at 5 x 10⁵ cells/mL in HEPES (15 mM)-buffered Hanks balanced salt solution containing Ca²⁺ (1.4 mM) and Mg²⁺ (0.7 mM), pH 7.4. Viability was assessed by Trypan blue exclusion and was typically greater than 98%.

B. Generation and Radioimmunoassay of LTB₄. PMNs (0.5 mL; 2.5 x 10⁵ cells) were placed in plastic tubes and incubated (37 °C, 2 min) with test compounds at the desired concentration or vehicle (DMSO, final concentration 0.2%) as control. The synthesis of LTB₄ was initiated by the addition of calcium ionophore A23187 (final concentration 10 mM) or vehicle in control samples and allowed to proceed for 5 minutes at 37 °C. The reactions were then terminated by the addition of cold methanol (0.25 mL) and samples of the entire PMN reaction mixture were removed for radioimmunoassay of LTB₄.

Samples (50 mL) of authentic LTB₄ of known concentration in radioimmunoassay buffer (RIA) buffer (potassium phosphate 1 mM; disodium EDTA 0.1 mM; Thimerosal 0.025 mM; gelatin 0.1%, pH 7.3) or PMN reaction mixture diluted 1:1 with RIA buffer were added to reaction tubes. Thereafter [³H]-LTB₄ (10 nCi in 100 mL RIA buffer) and LTB₄-antiserum (100 mL of a 1:3000 dilution in RIA buffer) were added and the tubes vortexed. Reactants were allowed to equilibrate by incubation overnight at 4 °C. To separate antibody-bound from free LTB₄, aliquots (50 mL) of activated charcoal (3% activated charcoal in RIA buffer containing 0.25% Dextran T-70) were added, the tubes vortexed, and allowed to stand at room temperature for 10 minutes prior to centrifugation (1500 x g; 10 min; 4 °C). The supernatants containing antibody-bound LTB₄ were decanted into vials and Aquasol 2 (4 mL) was added. Radioactivity was quantified by liquid scintillation spectrometry. Preliminary studies established that the amount of methanol carried into the radioimmunoassay did not influence the results. The specificity of the antiserum and the sensitivity of the procedure have been described by Rokach et al. (Prostaglandins Leukotrienes and Medicine 1984, 13, 21.) The amount of LTB₄ produced in test and control (approx. 20 ng/10⁶ cells) samples were calculated. Inhibitory dose-response curves were constructed using a four-parameter algorithm and from these the IC₅₀ values were determined.

Asthmatic Rat Assay

Rats are obtained from an inbred line of asthmatic rats. Both female (190-250 g) and male (260-400 g) rats are used.

Egg albumin (EA), grade V, crystallized and lyophilized, is obtained from Sigma Chemical Co., St. Louis. Aluminum hydroxide is obtained from the Regis Chemical Company, Chicago. Methysergide bimealeate was supplied by Sandoz Ltd., Basel.

The challenge and subsequent respiratory recordings are carried out in a clear plastic box with internal dimensions (10 x 6 x 4 inches) (10 x 6 x 4) x 2.54 cm. The top of the box is removable; in use, it is held firmly in place by four clamps and an airtight seal is maintained by a soft rubber gasket. Through the center

EP 0 419 049 B1

of each end of the chamber a Devilbiss nebulizer (No. 40) is inserted via an airtight seal and each end of the box also has an outlet. A Fleisch No. 0000 pneumotachograph is inserted into one end of the box and coupled to a Grass volumetric pressure transducer (PT5-A) which is then connected to a Beckman Type R Dynograph through appropriate couplers. While aerosolizing the antigen, the outlets are open and the pneumotachograph is isolated from the chamber. The outlets are closed and the pneumotachograph and the chamber are connected during the recording of the respiratory patterns. For challenge, 2 mL of a 3% solution of antigen in saline is placed into each nebulizer and the aerosol is generated with air from a small Potter diaphragm pump operating at (10 psi) 10 x 6,895 Pa and a flow of 8 liters/minute.

Rats are sensitized by injecting (subcutaneously) 1 mL of a suspension containing 1 mg EA and 200 mg aluminum hydroxide in saline. They are used between days 12 and 24 postsensitization. In order to eliminate the serotonin component of the response, rats are pretreated intravenously 5 minutes prior to aerosol challenge with 3.0 mg/kg of methysergide. Rats are then exposed to an aerosol of 3% EA in saline for exactly 1 minute, then their respiratory profiles are recorded for a further 30 minutes. The duration of continuous dyspnea is measured from the respiratory recordings.

Compounds are generally administered either orally 1-4 hours prior to challenge or intravenously 2 minutes prior to challenge. They are either dissolved in saline or 1% methocel or suspended in 1% methocel. The volume injected is 1 mL/kg (intravenously) or 10 mL/kg (orally). Prior to oral treatment rats are starved overnight. Their activity is determined in terms of their ability to decrease the duration of symptoms of dyspnea in comparison with a group of vehicle-treated controls. Usually, a compound is evaluated at a series of doses and an ED₅₀ is determined. This is defined as the dose (mg/kg) which would inhibit the duration of symptoms by 50%.

The invention is further defined by reference to the following examples, which are intended to be illustrative and not limiting. All temperatures are in degrees Celsius.

Example 1

3-[N-(p-Chlorobenzyl)-3-(t-butylthio)-5-(quinolin-2-ylmethoxy)indol-2-yl]-2, 2-dimethylpropanoic acid

Example 1A

3-[N-(p-Chlorobenzyl)-3-(t-butylthio)-5-(quinolin-2-ylmethoxy)indol-2-yl]-2,2-dimethylpropanoic acid

Step A: N-Acetyl-4-(quinolin-2-ylmethoxy)aniline

A mixture containing 2-(chloromethyl)quinoline hydrochloride (100.0 g), 4-acetamidophenol (70.69 g) and milled anhydrous potassium carbonate (194 g) was stirred in DMF (1.2 L) using a mechanical stirrer for 48 hours. The mixture was carefully poured onto ice/water (3 L) with vigorous stirring. After the ice had melted, the solid was filtered and rinsed thoroughly with water. It was recrystallized from 95% ethanol and filtered to give the title compound in three crops.

Step B: 4-(Quinolin-2-ylmethoxy)aniline

A suspension of N-acetyl-4-(quinolin-2-ylmethoxy)aniline (Step A, 108.9 g) in 1 L of 95% ethanol containing 10 M KOH (120 mL) was heated at reflux under nitrogen in a heating mantle. When the hydrolysis was complete (approx. 36 h), the reaction mixture was cooled and ethanol was partially removed under vacuum. The mixture was then diluted with water (200 mL) and the fine off-white crystals were collected and thoroughly rinsed with water. The material, after air-drying, yielded the title compound which was used as such in the next step.

Step C: 4-(Quinolin-2-ylmethoxy)phenylhydrazine

A quantity of 84 g of 4-(quinolin-2-ylmethoxy)aniline from Step B was suspended in 300 mL of deionized H₂O and 84 mL of 12 M HCl. The suspension was stirred vigorously to obtain a fine particle suspension. Then a precooled solution (5 ° C) of 23.88 g of sodium nitrite dissolved in 75 mL of deionized H₂O was added dropwise to the suspension at 5 ° C over 25 minutes. The solution was stirred at 5 ° C for 60 min to obtain the diazonium salt as a clear brown solution. The presence of excess HNO₂ was confirmed by KI-starch paper, and the pH of the solution was about 3.0. If a white suspension persisted after 1 h, the mixture was filtered through a glass wool plug, to give the diazonium salt in the filtrate.

EP 0 419 049 B1

In the meantime a sodium hydrosulfite solution was prepared by dissolving 321 g of sodium hydrosulfite (approx. 85% purity) in 2 L of deionized water, and cooled at 0° to 5° C. To this solution were added 15 mL of 2N NaOH and 2 L of ether. The biphasic solution was kept near 0° C by additon of crushed ice and was stirred vigorously. To this solution was added dropwise the diazonium salt solution with stirring maintained throughout. At the end of the addition an orange solid was formed and 600 mL of NaOH (2N) was added over 30 minutes. The reaction was finally stirred for 60 minutes at 25° C. The solid was collected, suspended in ether (1 L) and filtered. The process was repeated with 2 L of water to yield the title compound as a pale yellow solid after freeze-drying overnight. m.p. 73-85° C (dec).

Step D: 1-(p-Chlorobenzyl)-1-[4-(quinolin-2-yl-methoxy)phenyl]hydrazine

A quantity of 10 g of 4-(quinolin-2-ylmethoxy)phenylhydrazine from Step C was added to a solution of 10.5 mL of diisopropylethylamine and 150 mL of CH₂Cl₂. To the yellow suspension was added 9.11 g of p-chlorobenzyl chloride followed by 3.64 g of Bu₄NBr and 50 mL of CH₂Cl₂. The reaction was stirred for approximately 24 hours. When no starting material remained, the reaction was diluted with H₂O and extracted 3 times with CH₂Cl₂. The combined organic phase was washed once with water and dried (MgSO₄), filtered and evaporated to dryness. The solid residue was dried under vacuum overnight prior to being swished in ether/methanol 90/10 to give the title compound as a pale yellow solid. m.p. 130° C.

15 A 2L 3-necked flask equipped with a mechanical stirrer, pressure equalizing addition funnel, and nitrogen inlet was charged with diisopropylamine (28 mL, 200 mmol) and dry THF (400 mL). The mixture was cooled to 0 °C and a 1.6 M solution of butyl lithium in hexane (125 mL, 200 mmol) was then added over a 15 minute period and stirring was continued for an additional 45 minutes.

The resultant solution of lithium diisopropylamide (200 mmol) was cooled to -78 °C and then butyric
20 acid (9.1 mL, 100 mmol) was added over a 15 minute period. The reaction was allowed to warm to room temperature (1 hour) and then heated at 55 °C for 3.5 hours. The resultant gel was cooled to -78 °C and then treated 2,3-dichloro-1-propene (10.1 mL, 110 mmol) over a 15 minute period. The mixture was then allowed to warm to room temperature and stirred for 18 hours.

The reaction mixture was diluted with Et₂O (400 mL), extracted with H₂O (400 mL) and with NaOH 1N
25 (300 mL). The aqueous layers were combined, acidified with HCl (2N, until pH 1-2) and the product was extracted with EtOAc (2 x 300 mL). The organic layers were combined, washed with brine (200 mL) and dried over MgSO₄. Filtration and concentration gave a yellow oil which was dissolved in dry MeOH (150 mL) and acetyl chloride (1 mL) was added dropwise. The resultant solution was gently refluxed for 20 hours. The reaction was allowed to cool to room temperature and it was concentrated. The resultant residue

Filtration and concentration gave a yellow oil which was purified by Kugelrohr distillation (bp 110 °C at 0.2 mm Hg) to give pure (250 MHz NMR) methyl 4-chloro-2-ethyl-4-pentenoate.

Step B: Methyl 5-bromo-2-ethyl-4-oxopentanoate

The resulting yellow solution was stirred at room temperature for 1 hour. EtOAc (300 mL) and H₂O (200 mL) were added. The organic layer was separated, washed with H₂O, 1N NaOH, H₂O, brine and dried over MgSO₄. Filtration and
40 concentration gave a yellow liquid which was purified by flash chromatography (EtOAc/Hexane (1:9)) to give pure (NMR 250 MHz) methyl 5-bromo-2-ethyl-4-oxopentanoate.

Step C: Methyl 5-(t-butylthio)-2-ethyl-4-oxopentanoate

The reaction mixture was then allowed to warm to room temperature. After 18 hours the white solid was removed by filtration and the filtrate was concentrated. The resulting yellow residue was purified by flash chromatography (Et₂O/Hexane (9:50)) to give the pure title compound (250 MHz NMR).

3-[3-(3,3-Dimethyl-1-oxo-1-butyl-5-(quinolin-2-ylmethoxy)indol-2-yl]-2,2-dimethylpropanoic acid5 Step A: Methyl 3-[3-(t-butylthio)-5-methoxy indol-2-yl]-2,2-dimethylpropanoate

A mixture containing 4-methoxyphenyl hydrazine HCl (70.66 g, 0.405 mol) and methyl 5-(t-butylthio)-2,2-dimethyl-4-oxopentanoate (99.54 g, 0.405 mol) in ^tBuOH (400 ml) was heated at a gentle reflux for 48 hours. The mixture was allowed to cool to RT and the precipitated NH₄Cl was removed by filtration. The residue was concentrated and fractionated on a plug of silica using EtOAc/hexane (1:3) as eluent. Evaporation of the appropriate fraction gave an orange-brown solid which was crystallized from EtOH (100 ml). Yield from two crops afforded 55.6g of the title compound. ¹H NMR (CD₃COCD₃): δ 1.20(s, 6H); 1.25 (s, 9H) 3.33 (s, 2H); 3.62 (s, 3H); 3.81 ppm (s, 3H); in addition to aromatic protons.

15 Step B: Methyl 3-[5-hydroxyindol-2-yl]-2,2-dimethylpropanoate

To a solution of the compound from step A (25.50 g, 73 mmol) in CH₂Cl₂ (250 ml) at 0 °C was added AlCl₃ (87.70 g, 9 mol eq.) portion-wise. When the addition was complete, the ice-bath was removed and the mixture was stirred at RT for 3 hours. EtSH (27 ml, 5 mol eq.) was added and the resulting mixture was stirred for a further 5 hours. It was then slowly poured onto an ice-cold 1M solution of Na, K tartrate. The product was extracted into CH₂Cl₂ (x2) and the organic phase was washed with aq. NaCl (x3). Conventional work-up followed chromatography on silica gel using EtOAc/hexane 1:5 to 3:2 afforded 13.60 g of the title compound, 75% yield.

25 ¹H NMR (CDCl₃): δ 1.26 (s, 6H); 2.95 (s, 2H); 3.72 (s, 3H); 6.11 (s, 1H); 6.71 (bd, 1H); 6.95 (s, 1H); 7.16 (d, 1H); 7.26 ppm (s, 1H)

Step C: Methyl 3-[5-(quinolin-2-ylmethoxy)indol-2-yl]-2,2-dimethylpropanoate

30 A mixture of the phenol from step B (13.62 g, 55.14 mmol) and 2-bromomethylquinoline (12.85 g, 1.05 mol eq.) and anhydrous K₂CO₃ (15.22 g, 2 mol. eq.) in DMF (40 ml) was stirred at RT for 48 hours. The mixture was then poured onto ice/water and after all the ice had melted, the brown solid was collected and air-dried. The dried material was passed through a plug of silica (using EtOAc/hexane (1:3) as eluent) to remove the color; yield: 19 g, 88%.

35 Recrystallization from EtOH afforded 14.17g of pure title compound, m.p. 131-132 °C.

Step D: Methyl 3-[3-(3,3-dimethyl-1-oxo-1-butyl)-5-(quinolin-2-ylmethoxy)indol-2-yl]-2,2-dimethyl-propanoate

40 To a suspension of AlCl₃ (5.7 g, 42 mmol) in CH₂Cl₂ (30 mL) at 0 °C was added 3,3-dimethylbutanoyl chloride (2.4 mL, 17 mmol). After 15 minutes at 0 °C, a solution of the ester from step C (3.0 g, 7.7 mmol) in CH₂Cl₂ (10 mL) was added by double-tipped needle. The mixture was stirred a further 20 minutes, at which point it was poured into a mixture of 0.5 M Na, K tartrate (150 mL) and ice (100 g). The product was extracted with EtOAc, and the organic layer was washed successively with 0.5 M NaK tartrate, H₂O, and brine. The solvent was then removed and yellow/orange oil (3.5 g) was used without purification in the following step.

Step E: 3-[3-(3,3-Dimethyl-1-oxo-1-butyl)-5-(quinolin-2-ylmethoxy)indol-2-yl]-2,2-dimethylpropanoic acid

50 The crude ester from step D was dissolved in a mixture of MeOH (20 mL), THF (20 mL), and H₂O (5 mL). To this was added 10 M NaOH (2.3 mL, 23 mmol). After stirring for 3 hours, the solution was cooled to 0 °C, and HOAc (1.5 mL) was added dropwise. The solution was partly concentrated to remove the THF and MeOH, and the product was then extracted into EtOAc. The organic layer was washed with H₂O and brine. Step A: Methyl 3-[N-(4-chlorobenzyl)-3-trimethylacetyl-5-(quinolin-2-ylmethoxy)indol-2-yl]-2,2-dimethylpropanoate

Method A: The indole from Example 47, Step A (2.00 g, 3.9 mmol) and trimethylacetyl chloride (0.86 g, 7.1 mmol) were dissolved in sieve-dried CH₂Cl₂ (15 mL). The mixture was cooled to -25 °C and AlCl₃ (1.64 g, 12.3 mmol) was added in two portions 5 minutes apart. After 10 minutes at -20 to -25 °C, 7 mL of 2.5 M aqueous HOAc was added to the mixture such that the temperature stayed below -20 °C. The mixture was then warmed to RT and the layers were separated. The organic layer was washed with H₂O, saturated
